**SECOND STATEMENT OF EVIDENCE OF DOUGLAS ALEXANDER LATHAM  
IN RELATION TO ELASTIC RESPONSE SPECTRA ANALYSIS**

1. My full name is Douglas Alexander Latham. I reside in Christchurch. I am a Structural Engineer.
2. In accordance with the requirements of Rule 9.43 of the High Court Rules, I confirm that I have read the Code of Conduct for expert witnesses and that my evidence complies with the Code's requirements.
3. Matters on which I express an opinion are within my field of expertise.
4. I am employed by Alan Reay Consultants Limited ("ARCL"), an affected party in this Royal Commission hearing.

**Qualifications and experience**

5. I hold a Bachelor of Engineering with Honours (2010, University of Canterbury). I am a Graduate Member of the Institution of Professional Engineers New Zealand.
6. I have been employed by ARCL since completing my studies in January 2010, over which time I have worked on a number of analysis and design projects.
7. My full resume is **annexed** to this statement.

**Involvement in CTV Building analysis**

8. Together with Chris Urmson, another structural engineer employed by ARCL, I have been working with Dr Alan Reay on an investigation into the collapse of the CTV Building. This work has included:
  - (a) Reviewing the draft reports by the Department of Building and Housing ("DBH") in December 2011 and preparing comments on the draft report, a number of which were picked up and reflected in the final report;
  - (b) Carrying out a retrospective analysis of the building's compliance with the building code at the time of design and when the drag bars were fitted in 1991 as well as reviewing the DBH collapse scenario of the building using analytical tools designed for these purposes.

9. I have already filed three statements of evidence before the Commission being a statement of evidence dated 31 May 2012 and two affidavits dated 5 and 6 June 2012.
10. In preparing this evidence I have referred to and relied upon the following principal sources of information:
  - (a) CTV Building structural drawings;
  - (b) CTV Building Structural Specification;
  - (c) Calculations;
  - (d) Reports prepared for the DBH, comprising:
    - (i) CTV Building Collapse Investigation for the DBH prepared by Dr Clark Hyland and Ashley Smith; and
    - (ii) Chapter 5 (CTV Building) of the Expert Panel Report on the Structural Performance of Christchurch CBD Buildings in the 22 February 2011 Aftershock.
  - (e) NZS 3101:1982 (Code of Practice for the Design of Concrete Structures);
  - (f) NZS4203:1984: Code of Practice for General Structural Design and Design Loadings for Buildings.
  - (g) Other information referred to in my evidence including the Seismic Analysis Report I refer to below.
11. Following an interlocutory hearing in which such information was sought by ARCL and Dr Reay from the DBH and Compusoft Engineering Limited, in early June 2012 ARCL received copies of the full input files used by the authors of the DBH report for the ERSA analyses. I have used these files to assess the inputs for the DBH ERSA analysis and to carry out further analysis.

#### **Royal Commission ERSA panel**

12. I have been a member of the ERSA panel constituted as part of the Royal Commission into the collapse of the CTV Building pursuant to the Order as to Directions in Relation to the Elastic Response Spectra Analysis Evidence dated 18 June 2012.

13. The outcome of that panel is reported in a joint report prepared by Professor Carr. Areas of agreement and disagreement are noted in that joint report.
14. I am in disagreement with a number of issues relating to the ERSA. Most of those issues have been noted in the joint report to the Commission.
15. Due to my disagreement over some of the ERSA panel issues, I have carried out a further ERSA analysis. I have prepared a Seismic Analysis Report (copy **attached**) which sets out the analysis I have undertaken and the result of the analysis.
16. I wish to explain how this report came about, and its context in relation to other work that I have done. In particular, I have undertaken three tasks arising out of the ERSA panel work. They are:
  - (a) First, I have run a static analysis of the CTV Building to determine the forces and displacements that could be used in the design of the structure in 1986. In running a static analysis I did so with the assumptions that I consider are justified on a straightforward interpretation of the relevant information available in 1986.
  - (b) Second, I performed an ERSA using the static analysis to carry out the scaling required by the Code. Of course, in doing so I adopted the same assumptions used in the static analysis.
  - (c) Third, utilising the subsequent results of my analysis, I am in the process of completing a design review of the columns with a view to ascertaining whether there was compliance with the Code as it was in 1986.
17. It is important for me to record that as a member of the ERSA panel I have always promoted the dual viewpoints that:
  - (a) First an ERSA was not required in the circumstances of the CTV Building design; and

- (b) Second, if the ERSA was going to be run it should be re-run using inputs derived from 1986. I note here that any such analysis, including a static analysis, should also only be run using inputs derived from the 1986 circumstances.
18. I understood from the Order as to Directions dated 18 June 2012 that if agreement could not be reached amongst the ERSA panel on the Compusoft ERSA's reliability, that a further ERSA would be carried out (clause 4.4).
19. From the outset on the ERSA panel, I have challenged Compusoft's ERSA reliability and, as noted above, have promoted the need for a separate ERSA to be completed using 1986 derived inputs. Notwithstanding the possibility contemplated in clause 4.4 of the Order as to Directions, no separate ERSA was run by the ERSA panel. Accordingly, I determined that I would do an appropriate analysis myself.
20. In considering running an ERSA with 1986 derived inputs I came to the view that running an ERSA was not required under the Code. It was only once I got to the point of assessing the CTV Building for running an ERSA that I reached a definitive conclusion on this issue. I concluded that, instead, it was feasible and appropriate for a static analysis to be run for the CTV Building, and that analysis was all that was required.
21. In the process of running the analysis it occurred to me that I then had all the information I needed to undertake a design review of the columns measured against the Code as it was in 1986, so I am in the process of completing that review but have not finished writing it up. In this respect, as to timing, I note:
- (a) I had intended to complete my evidence arising out of my ERSA panel work by the end of this week in time for the Code Compliance evidence that I expected to give on 31 July and 1 August 2012, including a possible ERSA "hot tub"<sup>1</sup>. It is also relevant that it was only on 16 July that the joint ERSA report was signed and it became clear to me that the new ERSA contemplated under the 18 June Order as to Directions was not going to be run. I then set about completing the static analysis and ERSA tasks I have completed.

---

<sup>1</sup> As per the updated hearing schedule dated 27 June 2012.

- (b) On Monday 23 July I was informed that the ERSA "hot tub" would possibly proceed this week rather than next week<sup>2</sup>. That has required that I complete my evidence as soon as possible including, in particular and as a priority, that part of my evidence which relates to the ERSA panel work directly.
- (c) I intend filing my further evidence on design review of the columns, relevant to the Code compliance section of the hearing, as soon as possible.

**Summary of attached Seismic Analysis Report**

- 22. In summary, my Seismic Analysis Report on my static analysis and ERSA concludes:
  - (a) The CTV building is only of moderate eccentricity and therefore a static analysis can be used exclusively to determine the design forces and displacements for compliance with the 1986 Code.
  - (b) Under both the static analysis and ERSA the CTV Building complies with the drift limits in the Code<sup>3</sup>.
- 23. It can also be noted that the design drifts determined from both the static analysis and ERSA are such that the columns appear to comply based on the criteria used in the DBH CTV building collapse report by Messrs Hyland and Smith.

Dated this 25<sup>th</sup> day of July 2012

D A Latham

---

<sup>2</sup> As per the updated hearing schedule dated 21 July 2012.

<sup>3</sup> The inter-storey drift limit specified in clause 3.8.3 of NZS 4203:1984 was 0.83%. On my analysis, the building complied with this drift limit as the maximum inter-storey drift determined was 0.47% from the equivalent static analysis and 0.53% from the ERSA.

## EDUCATION

### Qualifications

Bachelor of Engineering with First Class Honours in Civil Engineering  
 University of Canterbury 2006-2009

### Professional Associations

Graduate Member of IPENZ 2010-present

---

## PROFESSIONAL EXPERIENCE

**Structural Engineer, Alan Reay Consultants Limited** 2010-present

### Selected Projects:

#### Analysis & Detailed Design Projects

##### *Kilmore Street Medical Centre*

Carried out structural analysis and detailed design of a three level post-tensioned steel rocking frame (steel PRESSS) medical building. Carried out non-linear static and non-linear time history analysis. Project peer reviewed by Professor Stefano Pampanin.

##### *St. Margaret's College Gymnasium & Chapel*

Carried out structural analysis and detailed design of a new gymnasium and auditorium, consisting of precast concrete walls and suspended floors and a steel framed roof. Project peer reviewed by Harris Foster.

##### *Basic Transport*

Carried out structural analysis and detailed design of a 1000m<sup>2</sup> industrial warehouse, with mezzanine office.

##### *Lot 4 & 5 Show Place*

Carried out structural analysis and detailed design of a four level post-tensioned precast concrete rocking wall (PRESSS) office building. Carried out non-linear static analysis. Project peer reviewed by Stefano Pampanin.

##### *Airport Business Park, Russley Road*

Carried out structural analysis and detailed design for a new suspended floor retrofitted into an existing industrial structure.

*Development – Corner Madras and Salisbury Streets*

Carried out analysis and detailed design of a two level precast concrete retail and office building.

*WDHB Carpark, Hamilton*

Carried out structural analysis and detailed design of a six level precast concrete carparking structure. Project peer reviewed by Harris Foster.

*Agriseeds Coating Plant*

Carried out structural analysis and detailed design of a 4000m<sup>2</sup> industrial warehouse.

**Analysis & Concept Design Projects***Office Building, Hereford Street*

Carried out a detailed strength assessment and seismic retrofit and repair methodology for a nine level reinforced concrete shear wall office building in Hereford Street.

*Office Building, Colombo Street*

Carried out a detailed strength assessment and seismic retrofit and repair methodology for a six level reinforced concrete shear wall office building in Colombo Street.

*Office Building, Colombo Street*

Carried out structural analysis and concept design work for a new ten storey office building in Colombo Street.

*Carpark Building Concept, Tuam Street*

Carried out structural analysis and concept design work for a four storey reinforced concrete carparking building in Tuam Street.

*Bio-Filter Tank Roof, Hastings Wastewater Treatment Plant*

Carried out a buckling analysis and concept design for a fibreglass dome room for the bio-filter tanks at the Hastings Wastewater Treatment Plant.

*Office Building, Lismore Street*

Carried out non-linear time history analysis on a two level rocking precast concrete wall structure. Discussed modelling approaches with Professor Athol Carr.

*St. John Emergency Services Building*

Carried out seismic analysis using static and modal methods for the design of a six storey reinforced concrete structure.

**Other Projects***Earthquake Assessments*

Carried out numerous assessments of buildings following the Canterbury earthquakes.

*Building Collapse, Invercargill*

Carried out detailed analysis on a single level industrial / office building that collapsed during the Invercargill snowstorm of 2010, acting as an expert witness.

*Building Collapse, Rangiora & Ashburton*

Carried out detailed analysis on two cold-formed steel buildings that collapsed during the Canterbury snowstorm of 2004 and 2006, acting as an expert witness.

Appendix A – CTV Building Seismic Mass Calculation

## 1. Introduction

### 1.1 Scope

The scope of this report covers the seismic analysis of the CTV building for the purposes of considering whether the design was consistent with the design standards and codes applicable at the time of design in 1986.

The analysis has been undertaken with a 1986 context in mind. The analysis does not intend to replicate the original design, however the basis of decisions made during the original design and the information available at the time of design have been considered and followed through where appropriate.

### 1.2 Analysis Procedure

The analysis procedure consists of running seismic analyses using ETABS to determine the lateral seismic design forces and deflections that are applicable for the design of the CTV building. Input data for the ETABS analysis has been documented in this report. The analyses have been carried out in accordance with the design loadings standard NZS4203:1984.

### 1.3 References

This report relies on and makes reference to the following documents:

- a) NZS 4203:1984 Code of practice for General Structural Design and Design Loadings for Buildings (& Commentary)
- b) NZS 3101:1982 Code of practice for the Design of Concrete Structures (& Commentary)
- c) Structural Drawings – Office Building – 249 Madras St, by ARCE dated August 1986
- d) Geotechnical report by Soils & Foundations
- e) Letter from Ian McCahon dated 5 June 2012
- f) HiBond literature applicable in 1986
- g) DBH CTV Building Collapse Report prepared by Dr. Clark Hyland and Mr. Ashley Smith
- h) ETABS Model Files (.e2k) used as part of the DBH reports and supplied to ARCL

## 2. Analysis Model

### 2.1 *DBH Model*

A three dimensional ETABS model of the CTV Building structure was developed and used as part of the DBH report by Dr. Hyland & Mr. Smith into the collapse of the CTV building. The input file for this model was supplied to ARCL in .e2k format in June 2012.

The model consisted of the main lateral structural elements, including the floor diaphragms, North core shear wall, South coupled shear wall and foundations. The model also included the secondary elements such as the beams and columns. Moment releases were applied to the beams to remove their contribution to the lateral resistance.

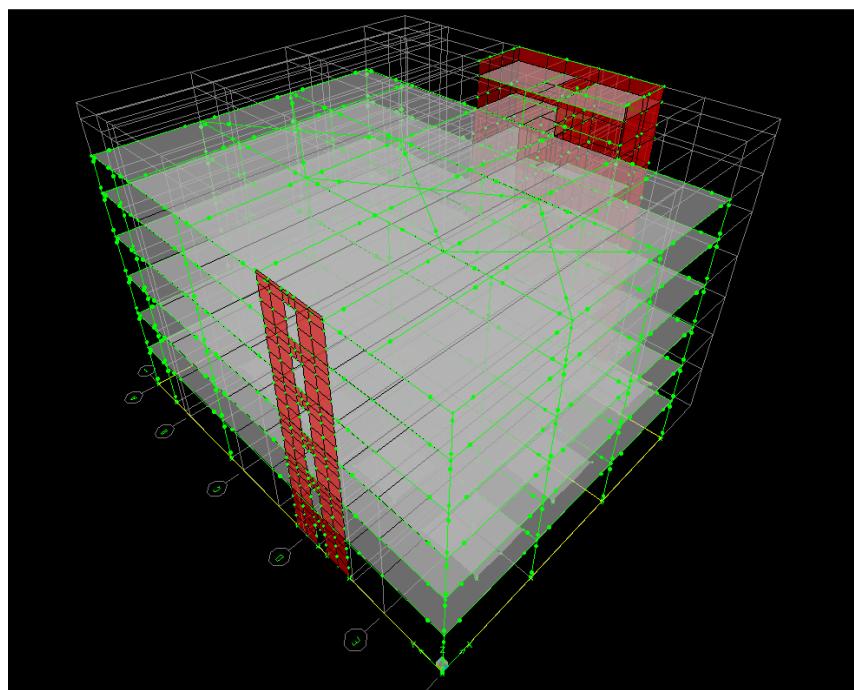

### 2.2 *Modifications to the DBH Model*

The DBH model file supplied to ARCL was modified by ARCL in a number of ways. The modifications included:

- Adjusting the building mass and location of centre of mass
- Adjusting the foundation stiffness
- Fully removing the contribution of the secondary elements (beams and columns) by making these null members
- Correcting the ground floor inter-storey height to 3.7m

A full list of inputs and assumptions considered in the ARCL analyses is presented in Section 3 of this report.

A screenshot of the model is shown below in Figure 1.

**Figure 1: Screenshot of ETABS 3D model of the CTV Building**

### 3. Modelling Inputs

#### 3.1 Building Mass

The mass or weight of the building has been calculated based on a detailed review of the available structural and architectural drawings. The key assumptions are presented in Table 1 below:

**Table 1: Mass Assumptions**

Element	Weight	Unit
Concrete	2400	kg/m <sup>3</sup>
Concrete	23.5	kN/m <sup>3</sup>
200mm thick HiBond floor	4.0	kPa
165mm thick HiBond floor	3.2	kPa
150mm thick HiBond floor	2.9	kPa
External Cladding	0.2	kPa
Super Imposed Dead Load (SDL) floor	0.5	kPa
Super Imposed Dead Load (SDL) roof	0.15	kPa
Live load, office general	2.5	kPa
Live load, toilets	2.0	kPa
Live load, machine rooms	5.0	kPa

In accordance with Clause 4.2.1 of NZS 4203:1984 the total reduced gravity load  $W_t$  for the purpose of calculating the horizontal seismic force has been calculated as the Dead load and one third Live load as per Equation 26B.

It has been assumed that the mass is lumped at each floor level at the center of mass (COM). The mass attributed to each floor level has been taken from the mid-storey height below the floor to the mid-storey height above the floor.

A summary of the calculated mass is presented in Table 2 below:

**Table 2: Summary of Building Mass**

Level	Weight, Wt (kN)	COM x' (m)	COM y' (m)	Rotational Inertia, I (kN.m <sup>2</sup> )
Level 8	473	25.24	12.30	7676
Level 7	920	18.32	13.76	126957
Level 6	5852	12.51	13.76	879875
Level 5	5941	12.61	13.76	896851
Level 4	6016	12.59	13.96	919660
Level 3	6151	12.56	14.32	959453
Level 2	6355	12.77	14.30	1002002
<b>Total</b>	<b>31708</b>			

In Table 2,  $x'$  and  $y'$  are measured from the intersection of Grid A and Grid 1, with positive  $x$  in the east direction and positive  $y$  in the north direction.

A detailed breakdown of the mass calculation is provided in Appendix A. The mass calculation in Appendix A has used a difference reference coordinate system.

### 3.2 Building Element Stiffness

The elements of the structure have been modelled with geometry and properties as per the ARCE structural drawings. The elastic modulus of concrete has been calculated in accordance with Clause 3.3.4.1 of NZS 3101:1982. Effective stiffnesses have been assigned to the shear walls in accordance with recommendations made in the paper "The Analysis and Design of and the Evaluation of Design Actions for Reinforced Concrete Ductile Shear Wall Structures" by T. Paulay and R Williams, published in 1980. A rigid diaphragm was applied to the floors.

A summary of the stiffness assumptions are presented in Table 3 below:

**Table 3: Summary of Building Element Stiffness**

Element	Specified Concrete Strength (MPa)	Elastic Modulus (MPa)	Effective Stiffness (le/Ig)
North Core Shear Walls	25 MPa	23500 MPa	0.6
South Shear Wall – Compression Pier	25 MPa	23500 MPa	0.8
South Shear Wall – Tension Pier	25 MPa	23500 MPa	0.5
South Shear Wall – Coupling Beams	25 MPa	23500 MPa	0.4
Floor Slab	25 MPa	23500 MPa	Rigid
Foundation Beams	20 MPa	21019 MPa	0.5

### 3.3 Foundation Stiffness

The foundations have been modelled with elastic springs to represent the foundation flexibility. The recommendations from Ian McCahon as per his 1985 report and outlined in his letter of 5 June 2012 have been adopted.

A summary of the foundation stiffnesses are presented in Table 4 below:

**Table 4: Summary of Foundation Stiffnesses**

Foundation Line	Width (m)	Area Stiffness (kN/m <sup>2</sup> /m)	Line Stiffness (kN/m/m)
Grid 1	3.0	5200	15600
Grid 1	2.5	5800	14500
Column Pad	4.0	4600	
Column Pad	4.5	4600	
Column Pad (soft)	4.5	2600	
Grid A	1.7	7660	13022
Grid F	2.5	5800	14500
Grid F (soft)	2.5	3500	8750
Grid 4	2.5	5800	14500
Grid 4 (soft)	2.5	3500	8750
Core	5.9	4600	
Core	8.2	4600	
Core (soft)	8.2	2600	
Core (soft)	5.9	2600	

## 4. Structural Characteristics

### 4.1 Natural Period of Vibration

The fundamental natural period of the building has been calculated using Rayleigh's Method in accordance with Equation 29 of NZS 4203:1984. The modal period determined from the 3D ETABS model has also been considered. The natural periods are presented in Table 5 below:

**Table 5: Natural Period of Vibration**

Direction	Rayleigh's Method Period, T (sec)	Modal Method Period, T (sec)
North-South	2.07 sec	2.07 sec (1 <sup>st</sup> mode)
East-West	1.19 sec	1.27 sec (2 <sup>nd</sup> mode)

The first mode is purely translational so the first mode natural period is in very close agreement to the period obtained from Rayleigh's Method. The second mode has a degree of torsional behaviour in addition to translational, so there is a small difference between the second mode natural period and the period obtained using Rayleigh's Method.

### 4.2 Centre of Rigidity

The centre of rigidity (COR), also known as the centre of stiffness or centre of rotation, was determined from the ARCL 3D ETABS model.

A summary of the COR coordinates along with the COM coordinates and difference to the COM, is presented in Tables 6 and 7 below:

**Table 6: Centre of Rigidity Coordinates, x**

Level	COR x' (m)	COM x' (m)	COR-COM (m)
Level 8	20.58	25.24	-4.66
Level 7	19.79	18.32	1.47
Level 6	19.45	12.51	6.94
Level 5	19.00	12.61	6.39
Level 4	18.49	12.59	5.90
Level 3	17.91	12.56	5.35
Level 2	17.24	12.77	4.47

**Table 7: Centre of Rigidity Coordinates, y**

Level	COR y' (m)	COM y' (m)	COR-COM (m)
Level 8	13.61	12.30	1.31
Level 7	13.51	13.76	-0.25
Level 6	13.41	13.76	-0.35
Level 5	13.27	13.76	-0.49
Level 4	13.14	13.96	-0.82
Level 3	13.01	14.32	-1.31
Level 2	12.93	14.30	-1.37

#### 4.3 Degree of Eccentricity

A definition for the degree of eccentricity was suggested in the commentary to NZS 4203:1984. In Clause C3.4.7.1 the code stated “*Structures of moderate eccentricity are those for which the torsional component of shear load in the element most unfavourably affected does not exceed three quarters of the lateral translational component of shear load.*” It can be taken that the structure was considered to have a high degree of eccentricity if the torsional component did exceed three quarters of the translational component of shear load.

The translational and torsional components of shear load can be determined from principles of statics using the centre of mass and centre of rigidity coordinates.

The translational component of shear load can be considered by applying the horizontal forces through the centre of rigidity (COR), thus generating zero rotation. The shear components in each wall are dependent on the relative distances from the point of applied force or COR. A distribution of horizontal force has been assumed in proportion to the storey mass and height, in accordance with the equivalent static method of NZS 4203:1984. An arbitrary base shear of 10000kN has been applied.

For the East-West direction of loading, the translational components of the shear load along Grids 1 and 5 are presented in Table 8 below:

**Table 8: Translational Component of Shear Load**

Level	Fi (kN)	e1 (m)	e2 (m)	V1 (kN)	V5 (kN)
Level 8	277.2	20.58	6.32	65	212
Level 7	479.4	19.79	7.11	127	353
Level 6	3637.9	19.45	7.45	1007	2631
Level 5	2157.2	19.00	7.90	634	1524
Level 4	1657.0	18.49	8.41	518	1139
Level 3	1155.0	17.91	8.99	386	769
Level 2	636.2	17.24	9.67	229	408
<b>Sum</b>	<b>10000</b>			<b>2965</b>	<b>7035</b>
<b>Three quarters</b>				<b>2224</b>	<b>5276</b>

The torsional component of shear load can be considered by applying a moment at the centre of rigidity (COR) equal to the product of the horizontal force applied at that level and the eccentricity between the centre of mass and centre of rigidity at that level. For the East-West direction of loading, the torsional components of the shear load along Grids 1 and 5 are presented in Table 9 below:

**Table 9: Torsional Component of Shear Load**

Level	Fi (kN)	COM-COR (m)	M* (kNm)	V1 (kN)	V5 (kN)
Level 8	277.2	-4.66	-1291	-48	48
Level 7	479.4	1.47	706	26	-26
Level 6	3637.9	6.94	25262	939	-939
Level 5	2157.2	6.39	13780	512	-512
Level 4	1657.0	5.90	9773	363	-363
Level 3	1155.0	5.35	6179	230	-230
Level 2	636.2	4.47	2841	106	-106
<b>Sum</b>	<b>10000</b>			<b>2128</b>	<b>-2128</b>

The most unfavourably affected element is the coupled shear wall along Grid 1. The torsional component of shear load is less than three quarters of the translation component of shear load, therefore it can be concluded that the structure was only of moderate eccentricity as per the NZS 4203:1984 definition for the East-West direction of loading.

For the North-South direction of loading, the eccentricity between the COM and the COR is much smaller than the East-West direction. In fact the structure is near symmetric in the North-South direction. It is clear that the structure was only of moderate eccentricity as per the NZS 4203:1984 definition for the North-South direction of loading.

## 5. Equivalent Static Analysis

### 5.1 *Total Horizontal Force*

In accordance with NZS 4203:1984, the total design horizontal force has been calculated, and is presented in Table 10 below:

**Table 10: Total Horizontal Force**

Factor	Symbol	North-South Direction	East-West Direction
Natural Period	T	2.07 sec	1.19 sec
Seismic Coefficient	C	0.075	0.076
Risk Factor	R	1.0	1.0
Structural Type Factor	S	1.0	1.0
Material Factor	M	0.8	0.8
Design Coefficient	$C_d = CRSM$	0.0600	0.0607
Seismic Weight	Wt	31708 kN	31708 kN
<b>Design Base Shear</b>	<b>V=Cd.Wt</b>	<b>1902 kN</b>	<b>1924 kN</b>

### 5.2 *Distribution of Horizontal Seismic Forces*

The horizontal force has been distributed up the height of the structure in accordance with NZS 4203:1984, and is presented in Table 11 below:

**Table 11: Distribution of Horizontal Seismic Forces**

Level	Weight, Wt (kN)	Height, h (m)	Wt x h (kN.m)	North-South Force (kN)	East-West Force (kN)
Level 8	473	21.66	10245	52.7	53.3
Level 7	920	19.26	17719	91.2	92.2
Level 6	5852	16.66	97494	692.1	700.0
Level 5	5941	13.42	79728	410.4	415.1
Level 4	6016	10.18	61243	315.3	318.8
Level 3	6151	6.94	42688	219.7	222.2
Level 2	6354	3.70	23514	121.0	122.4
<b>Total</b>	<b>31709</b>		<b>332631</b>	<b>1902</b>	<b>1924</b>

Note that 0.1V has been applied at Level 6, being the top storey, in accordance with Clause 3.4.6.1 of NZS 4203:1984. The remaining 0.9V has been distributed in proportion to the floor mass and height.

### 5.3 *Horizontal Torsional Moments*

Horizontal torsional moments have been considered in accordance with NZS 4203:1984 by applying the horizontal seismic shear force in turn at two points each distant 0.1b from the centre of mass. The locations for the application of horizontal seismic shear force are presented in Tables 12 and 13 below:

**Table 12: Coordinates for Application of Horizontal Force, X Direction**

<b>Level</b>	<b>COM x'</b> <b>(m)</b>	<b>+0.1b COM x'</b> <b>(m)</b>	<b>-0.1b COM x'</b> <b>(m)</b>
Level 8	25.24	25.68	24.80
Level 7	18.32	21.01	15.63
Level 6	12.51	15.20	9.82
Level 5	12.61	15.30	9.92
Level 4	12.59	15.28	9.90
Level 3	12.56	15.25	9.87
Level 2	12.77	15.46	10.08

**Table 13: Coordinates for Application of Horizontal Force, Y Direction**

<b>Level</b>	<b>COM y'</b> <b>(m)</b>	<b>+0.1b COM y'</b> <b>(m)</b>	<b>-0.1b COM y'</b> <b>(m)</b>
Level 8	12.30	13.43	11.16
Level 7	13.76	16.79	10.74
Level 6	13.76	16.78	10.73
Level 5	13.76	16.78	10.73
Level 4	13.96	16.99	10.94
Level 3	14.32	17.34	11.29
Level 2	14.30	17.33	11.28

#### 5.4 Shear Wall Design Forces

From the ETABS analysis model, the design shear forces can be determined in each of the shear walls.

The core wall complex is the main lateral load resisting element for North-South actions, therefore resists nearly all of the design shear load. For East-West actions, the critical load case for the core wall design shear is with a 0.1b eccentricity applied North of the centre of mass.

For the South coupled shear wall, the wall is predominately acting in the East-West direction. The critical load case is with a 0.1b eccentricity applied South of the centre of mass.

A summary of the design shear forces in each of the shear walls is presented in Table 14 below:

**Table 14: Shear Wall Design Forces (kN), Equivalent Static Analysis**

<b>Shear Wall:</b>	<b>EQ Direction</b>		
	<b>North-South</b>	<b>East-West</b>	<b>East-West</b>
	<b>Core</b>	<b>Core</b>	<b>South Wall</b>
<b>Load Case:</b>	<b>EQSX</b>	<b>EQSYP</b>	<b>EQSYN</b>
Level 8	52.7	53.3	-
Level 7	145.0	116.2	42.8
Level 6	832.4	517.6	469.6
Level 5	1243.9	751.1	728.3
Level 4	1552.9	927.8	929.4
Level 3	1790.6	1060.9	1063.7
Level 2	1817.4	758.0	1438.9

The bending moment up the height of the wall can be obtained by taking the product of the difference in shears at each level and the height from that level to the point of interest.

### 5.5 Building Deflections

The building deflections have been determined from the ETABS analysis model, and scaled in accordance with NZS 4203:1984. Deflections have been calculated neglecting foundation rotations in accordance with Clause 3.8.1.2 of NZS 4203:1984. The deflections have then been scaled by the K/SM factor where K=2 for equivalent static analysis.

For North-South actions, the critical case for deflections was along Grid A, with a 0.1b eccentricity West of the centre of mass. The deflections along Grid F have also been considered, applying a 0.1b eccentricity East of the centre of mass. A summary of the deflections is presented in Tables 15 and 16 below:

**Table 15: North-South Deflections along Grid A**

Level	ETABS Elastic Deflection (mm)	ETABS Foundation Rotation (mm)	K/SM Scaled Deflection (mm)	Inter- storey Drift (mm)	Inter- storey Drift (%)
7	133.2	101.9	78.3	12.2	0.47
6	114.6	88.1	66.1	15.3	0.47
5	91.3	71.0	50.8	15.0	0.46
4	68.2	53.9	35.8	14.0	0.43
3	45.4	36.7	21.8	12.4	0.38
2	23.3	19.6	9.4	9.4	0.25

**Table 16: North-South Deflections along Grid F**

Level	ETABS Elastic Deflection (mm)	ETABS Foundation Rotation (mm)	K/SM Scaled Deflection (mm)	Inter- storey Drift (mm)	Inter- storey Drift (%)
7	129.5	100.9	71.3	11.7	0.45
6	111.2	87.3	59.6	14.6	0.45
5	88.3	70.3	45.0	14.1	0.44
4	65.7	53.4	30.9	12.9	0.40
3	43.5	36.4	17.9	10.8	0.33
2	22.2	19.4	7.1	7.1	0.19

For East-West actions, the critical case for deflections was along Grid 1, with a 0.1b eccentricity South of the centre of mass. The deflections along Grid 2 have also been considered, with the same eccentricity. A summary of the deflections is presented in Tables 17 and 18 below:

**Table 17: East-West Deflections along Grid 1**

Level	ETABS Elastic Deflection (mm)	ETABS Foundation Rotation (mm)	K/SM Scaled Deflection (mm)	Inter- storey Drift (mm)	Inter- storey Drift (%)
7	65.0	37.1	69.9	11.9	0.46
6	55.3	32.1	58.1	15.0	0.46
5	43.0	25.8	43.0	14.6	0.45
4	31.0	19.6	28.4	13.0	0.40
3	19.5	13.4	15.4	10.1	0.31
2	9.3	7.1	5.3	5.3	0.14

**Table 18: East-West Deflections along Grid 2**

Level	ETABS Elastic Deflection (mm)	ETABS Foundation Rotation (mm)	K/SM Scaled Deflection (mm)	Inter- storey Drift (mm)	Inter- storey Drift (%)
7	53.9	32.0	54.7	9.1	0.35
6	45.9	27.7	45.5	11.6	0.36
5	35.9	22.3	33.9	11.3	0.35
4	26.0	16.9	22.6	10.1	0.31
3	16.5	11.5	12.5	8.0	0.25
2	8.0	6.1	4.5	4.5	0.12

## 6. Spectral Modal Analysis

### 6.1 Requirement for Spectral Modal Analysis

A spectral modal analysis was not required for this building. Clause 3.3.9 of NZS 4203:1984 states “Buildings shall be analysed by the equivalent static force method... In addition a spectral modal analysis shall be approved for any building and may be required by the Engineer for any building, where, in his opinion, special circumstances exist, for example where a building is of particular importance to the community, or where a special study is required...” The CTV building was not subject to any of these special circumstances.

Further, Clause 3.4.7 of NZS 4203:1984 outlines methods for dealing with horizontal torsional moments and accidental eccentricities. There are three sub-clauses for dealing with different types of structures:

- a) Reasonably regular symmetric or moderately eccentric structures
- b) Reasonably regular structures with a high degree of eccentricity
- c) Irregular structures

The CTV building was reasonably regular and only of moderate eccentricity, as shown in Section 4 of this report.

The requirements of part a) of this clause required horizontal torsional effects to be taken into account either by the static method, two-dimensional modal analysis method, or the three-dimensional modal analysis method. Any of these methods are considered valid, and there is no requirement to consider one analysis method over the other. For completeness, a spectral modal analysis will be considered in addition to the equivalent static analysis, although it is not specifically required.

### 6.2 Design Spectrum and Scaling

The design spectrum has been determined from the spectrum presented in Figure 3 of NZS 4203:1984. This spectrum has been scaled by a factor K such that the both the computed base shear from the spectral modal analysis is not less than 90% of the equivalent static base shear, and that the shear at any level from the spectral modal analysis is not less than 80% of the equivalent static force, in accordance with the procedures outlined in NZS 4203:1984. A summary of the scaling factors K is presented in Table 19 below:

**Table 19: Spectral Modal Analysis Scaling Factor, K**

Direction	COM	+0.1b COM	-0.1b COM
North-South	0.854	0.869	0.877
East-West	1.003	0.977	1.030

### 6.3 Horizontal Torsional Moments

Horizontal torsional moments have been considered in accordance with NZS 4203:1984 by considering the effective location of the centre of mass to be in turn at two points each distant 0.1b from the actual centre of mass. The locations for the effective centre of mass are as per Tables 12 and 13,

presented in Section 5 of this report. The rotational inertia was applied at the actual centre of mass for all cases.

#### 6.4 Combination of Modes

In accordance with NZS 4203:1984, the modes have been combined using the square root of the sum of the squares method. The first 20 modes have been considered, in excess of the minimum number specified in NZS 4203:1984.

#### 6.5 Shear Wall Design Forces

From the ETABS analysis model, the design shear forces can be determined in each of the shear walls.

The core wall complex is the main lateral load resisting element for North-South actions, therefore resists nearly all of the design shear load. For East-West actions, the critical load case for the core wall shears is with a 0.1b eccentricity applied North of the centre of mass.

For the south coupled shear wall, the wall is predominately acting in the East-West direction. The critical load case is with a 0.1b eccentricity applied South of the centre of mass.

A summary of the design shear forces in each of the shear walls is presented in Tables 20 below:

**Table 20: Shear Wall Design Forces (kN), Spectral Modal Analysis**

	EQ Direction		
	North-South	East-West	East-West
<b>Shear Wall:</b>	Core	Core	South Wall
<b>Load Case:</b>	<b>SMX</b>	<b>SMYP</b>	<b>SMYN</b>
Level 8	79.6	61.4	
Level 7	193.2	125.9	71.5
Level 6	708.1	395.1	514.4
Level 5	1060.2	591.7	804.8
Level 4	1322.2	738.2	1016.7
Level 3	1559.3	857.5	1193.6
Level 2	1643.1	656.9	1455.5

#### 6.6 Building Deflections

The building deflections have been determined from the ETABS analysis model, and scaled in accordance with NZS 4203:1984. Deflections have been calculated neglecting foundation rotations in accordance with Clause 3.8.1.2 of NZS 4203:1984. The deflections have then been scaled by the K/SM factor where K=2.2 for equivalent static analysis.

For North-South actions, the critical case for deflections was along Grid A, with a 0.1b eccentricity West of the centre of mass. The deflections along Grid F have also been considered, applying a 0.1b eccentricity East of the centre of mass. A summary of the deflections is presented in Tables 21 and 22 below:

**Table 21: North-South Deflections along Grid A**

Level	ETABS Elastic Deflection (mm)	ETABS Foundation Rotation (mm)	K/SM Scaled Deflection (mm)	Inter- storey Drift (mm)	Inter- storey Drift (%)
7	115.9	86.9	79.8	12.4	0.48
6	99.7	75.2	67.4	15.5	0.48
5	79.5	60.6	51.9	15.2	0.47
4	59.3	45.9	36.8	14.3	0.44
3	39.5	31.3	22.5	12.7	0.39
2	20.3	16.7	9.8	9.8	0.26

**Table 22: North-South Deflections along Grid F**

Level	ETABS Elastic Deflection (mm)	ETABS Foundation Rotation (mm)	K/SM Scaled Deflection (mm)	Inter- storey Drift (mm)	Inter- storey Drift (%)
7	112.8	87.0	71.1	11.6	0.45
6	96.9	75.2	59.5	14.5	0.45
5	77.0	60.6	45.0	14.1	0.43
4	57.2	46.0	31.0	12.9	0.40
3	37.9	31.3	18.1	10.8	0.33
2	19.4	16.7	7.3	7.3	0.20

For East-West actions, the critical case for deflections was along Grid 1, with a 0.1b eccentricity South of the centre of mass. A summary of the deflections is presented in Table 23 below:

**Table 23: East-West Deflections along Grid 1**

Level	ETABS Elastic Deflection (mm)	ETABS Foundation Rotation (mm)	K/SM Scaled Deflection (mm)	Inter- storey Drift (mm)	Inter- storey Drift (%)
7	67.2	38.1	80.0	13.6	0.52
6	57.2	33.0	66.5	17.1	0.53
5	44.5	26.6	49.3	16.7	0.51
4	32.0	20.2	32.6	15.0	0.46
3	20.2	13.7	17.6	11.6	0.36
2	9.5	7.3	6.0	6.0	0.16

## 7. Conclusions

### 7.1 *Degree of Eccentricity*

As shown in this report, the CTV building can be considered to have only a moderate degree of eccentricity. On this basis, the structure can be analysed using the static method and / or the spectral modal method. It is acceptable to use either method exclusively.

### 7.2 *Compliance with Inter-storey Drift Limits*

The inter-storey drift limit specified in Clause 3.8.3 of NZS 4203:1984 was 0.83%. It can be concluded that the building complied with this drift limit, as the maximum inter-storey drift determined was 0.47% from the equivalent static analysis and 0.53% from the spectral modal analysis.

### 7.3 *Further Work*

The design forces and deflections determined in this report can be used as the basis for assessing whether the structural elements were designed in accordance with the relevant codes and standards. Further work is required to carry out this assessment.

### 7.4 *Column Compliance*

The DBH CTV Building Collapse Report by Dr. Hyland and Mr. Smith has determined the elastic deformation limits for the columns, as shown in Tables 13 and 14 of their report. This appears to be the basis for determining whether the column design was in accordance with the relevant codes and standards.

It is noted that the drift levels determined from both the equivalent static analysis and the spectral modal analysis do not exceed the elastic deformation limits determined in the DBH report.

**APPENDIX A – CTV BUILDING SEISMIC MASS CALCULATION**

## Calculation of Seismic Mass - 249 Madras St

### Legend

Origin	Intersection of Grid A and Grid 1
Positive X Direction	Increasing letter grids (A-F)
Positive Y Direction	Increasing number grids (1-5)
Level 1	Ground floor (as per drawings)
Level 2	First suspended floor (as per drawings)
...	Etc.
Level 7	Roof (as per drawings)
Level 8	Plant deck (as per drawings)

### Generic Weights

Concrete	23.5 kN/m <sup>3</sup>	(2400 kg/m <sup>3</sup> )
200 Hibond Floor	4.0 kPa	Refer HiBond Literature
165 HiBond Floor	3.2 kPa	Refer HiBond Literature
150 HiBond Floor	2.9 kPa	Refer HiBond Literature
External Cladding	0.2 kPa	Lightweight / Single Glazing
SDL	0.5 kPa	Typical floor
	0.15 kPa	Roof
Live	2.5 kPa	Office general
	2.0 kPa	Toilets
	5.0 kPa	Machine rooms
Seismic Live	L/3	For L=5.0kPa or less
